

mCH change against MeCP2 binding change by histone mark context

Categories from the chromatin state of section 10_01: K27ac only (body state Active), Bivalent (bivalent promoter or Mixed body), K27me3 only (Polycomb body, promoter not bivalent), Neither

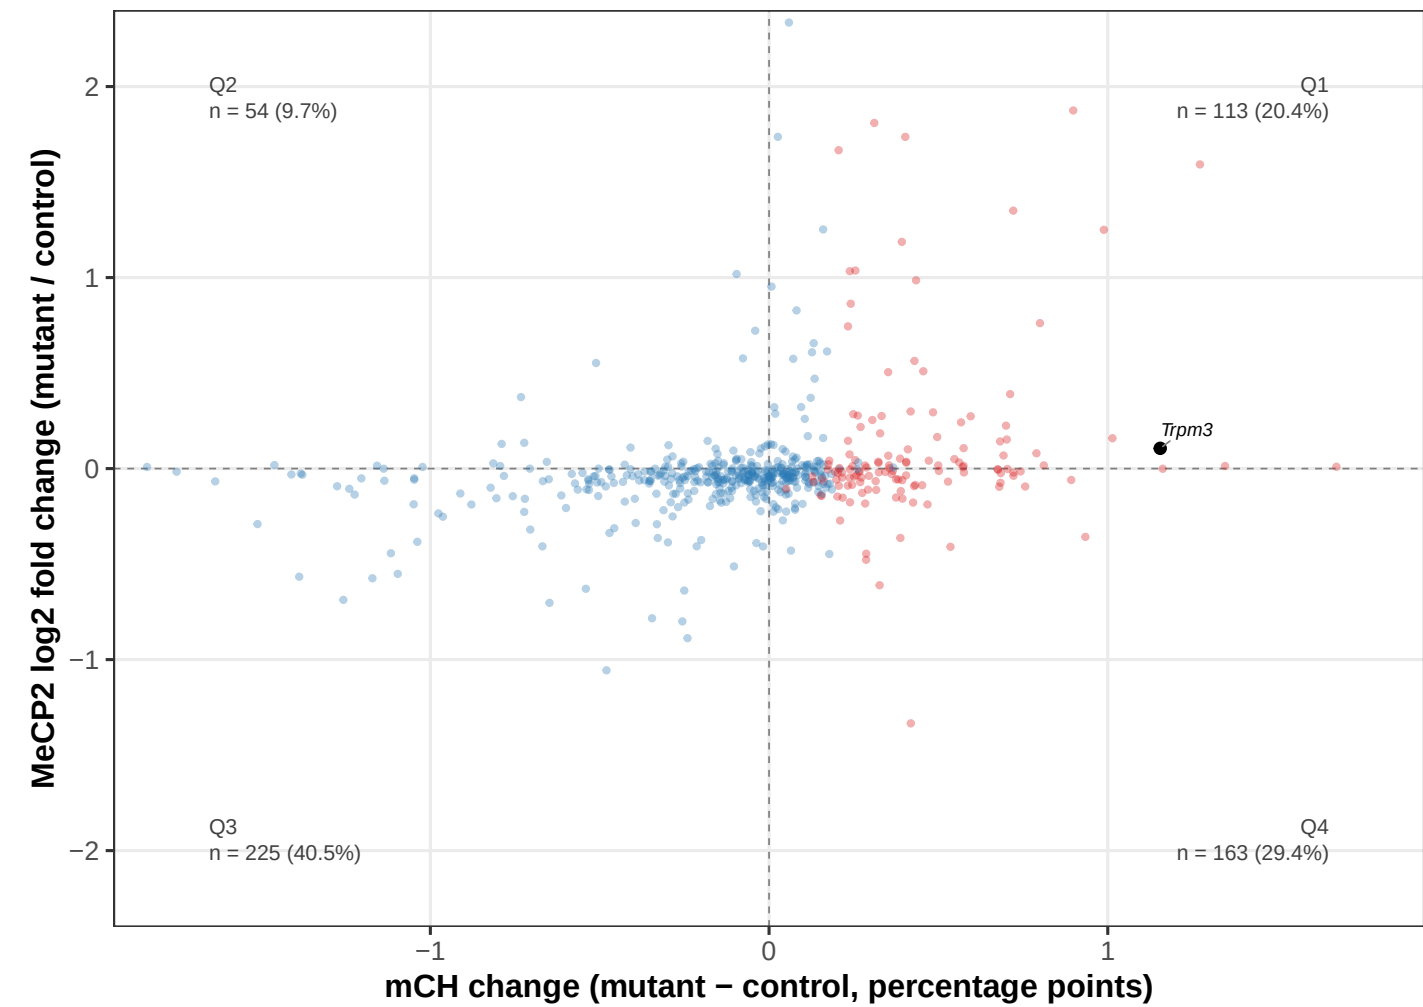

K27ac only

Spearman rho = 0.168 [0.137, 0.197], p < 2.2e-16 | n = 4,269 genes

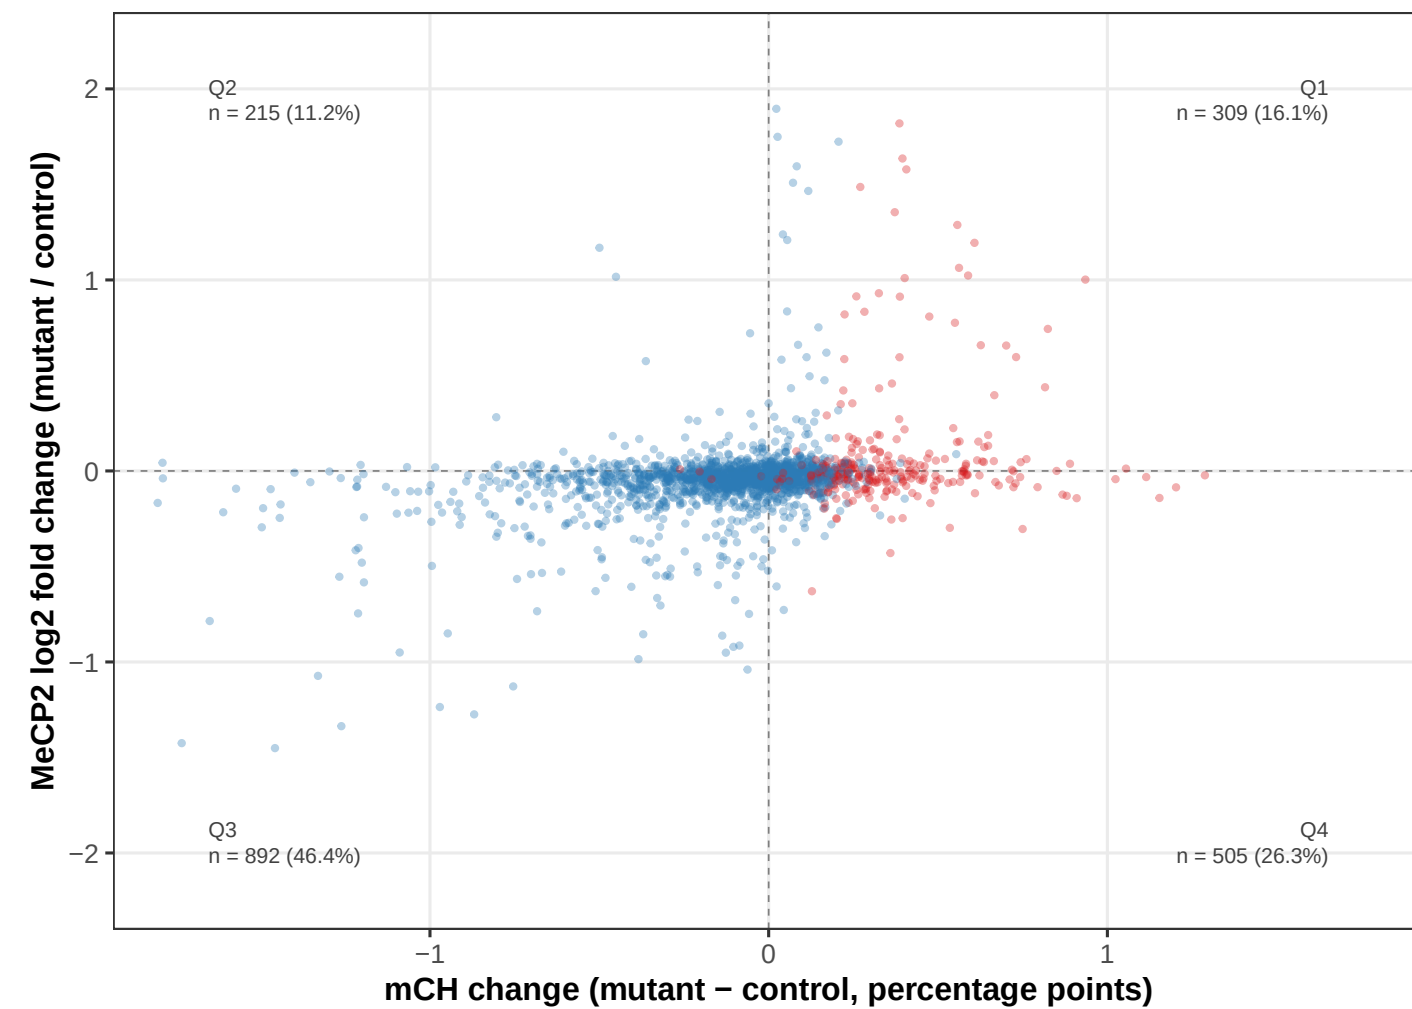

Bivalent

Spearman rho = 0.307 [0.227, 0.383], p = 1.43e-13 | n = 555 genes

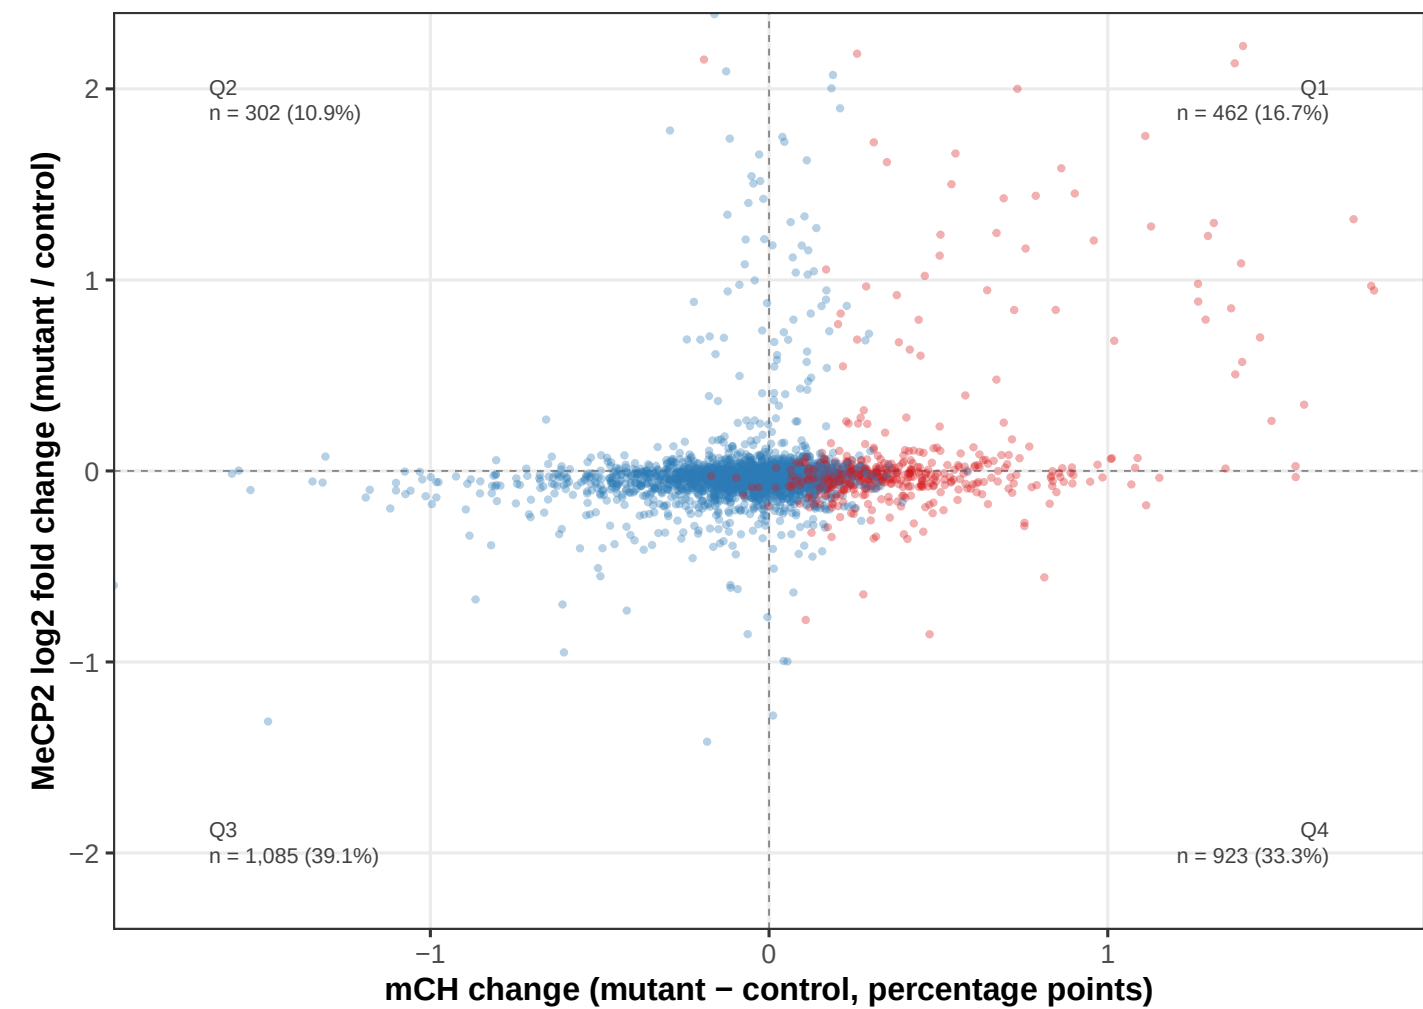

K27me3 only

Spearman rho = 0.302 [0.260, 0.344], p < 2.2e-16 | n = 1,921 genes

Neither

Spearman rho = 0.173 [0.136, 0.210], p < 2.2e-16 | n = 2,772 genes

mCH direction ● Hypermethylated ● Hypomethylated

All four panels share one x scale and one y scale, clipped to the 99.5th percentile of the absolute value. Every gene enters the correlation and the quadrant counts.
