

Chromatin remodeling at neuronal genes inside K119ub level strata

Equal-count deciles of the control K119ub gene-body signal, so the K119ub level cannot drive a within-decile difference

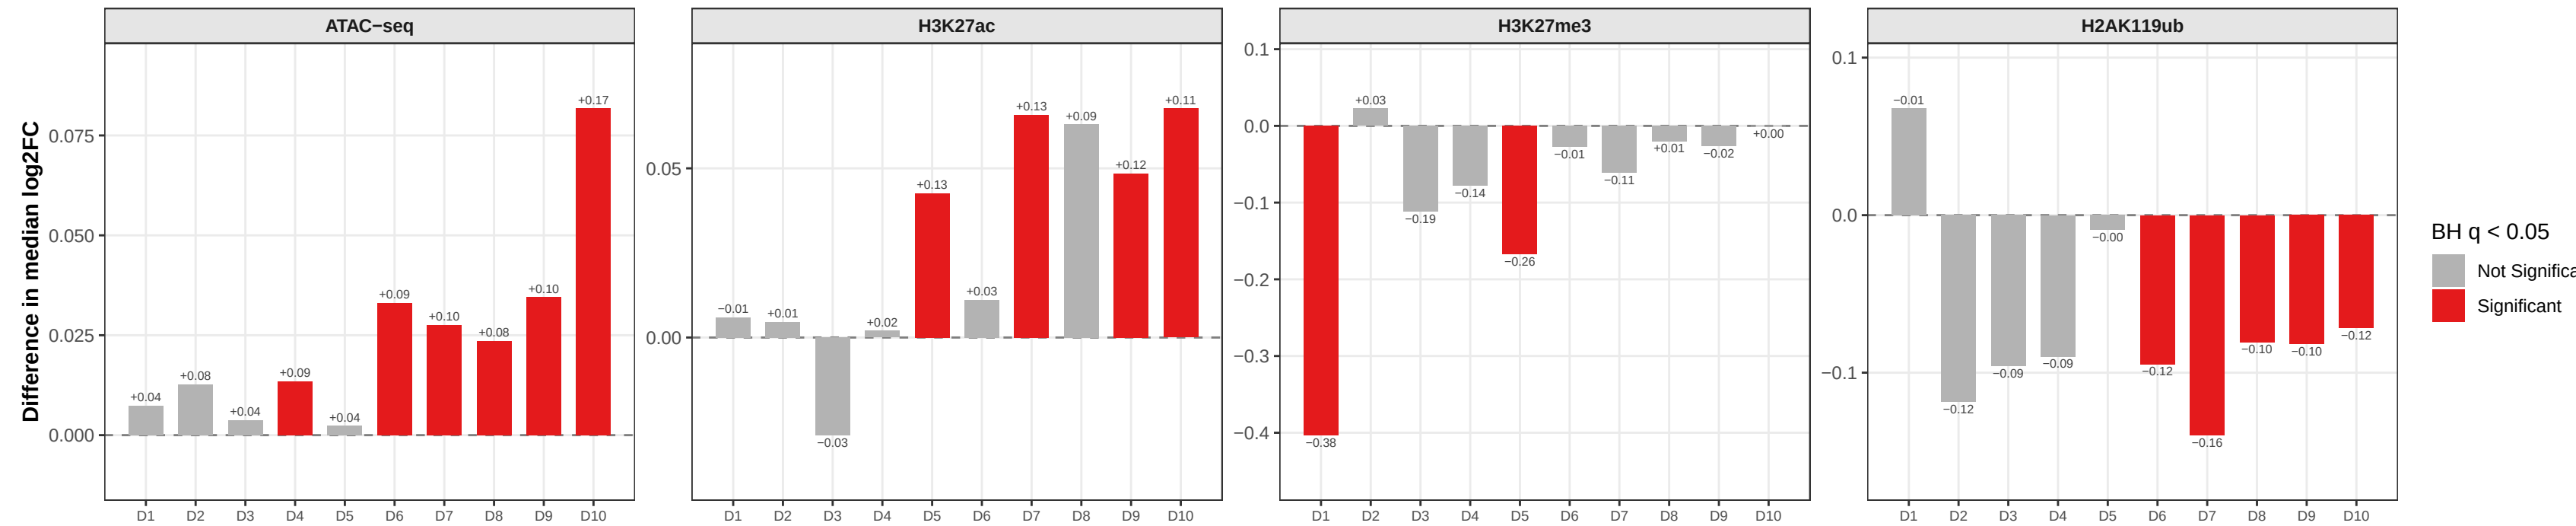

Median mark fold change across control K119ub signal deciles

Band shows the interquartile range of each class in each decile

Median difference, neuronal minus other, inside each decile

Number above each bar is the rank-biserial correlation of that cell

Genes with a measured fold change in each decile
