

Polycomb target enrichment in BAP1-KO differential mCH

Inaccessible-heterochromatin prediction: Polycomb genes depleted from mCH hypermethylation

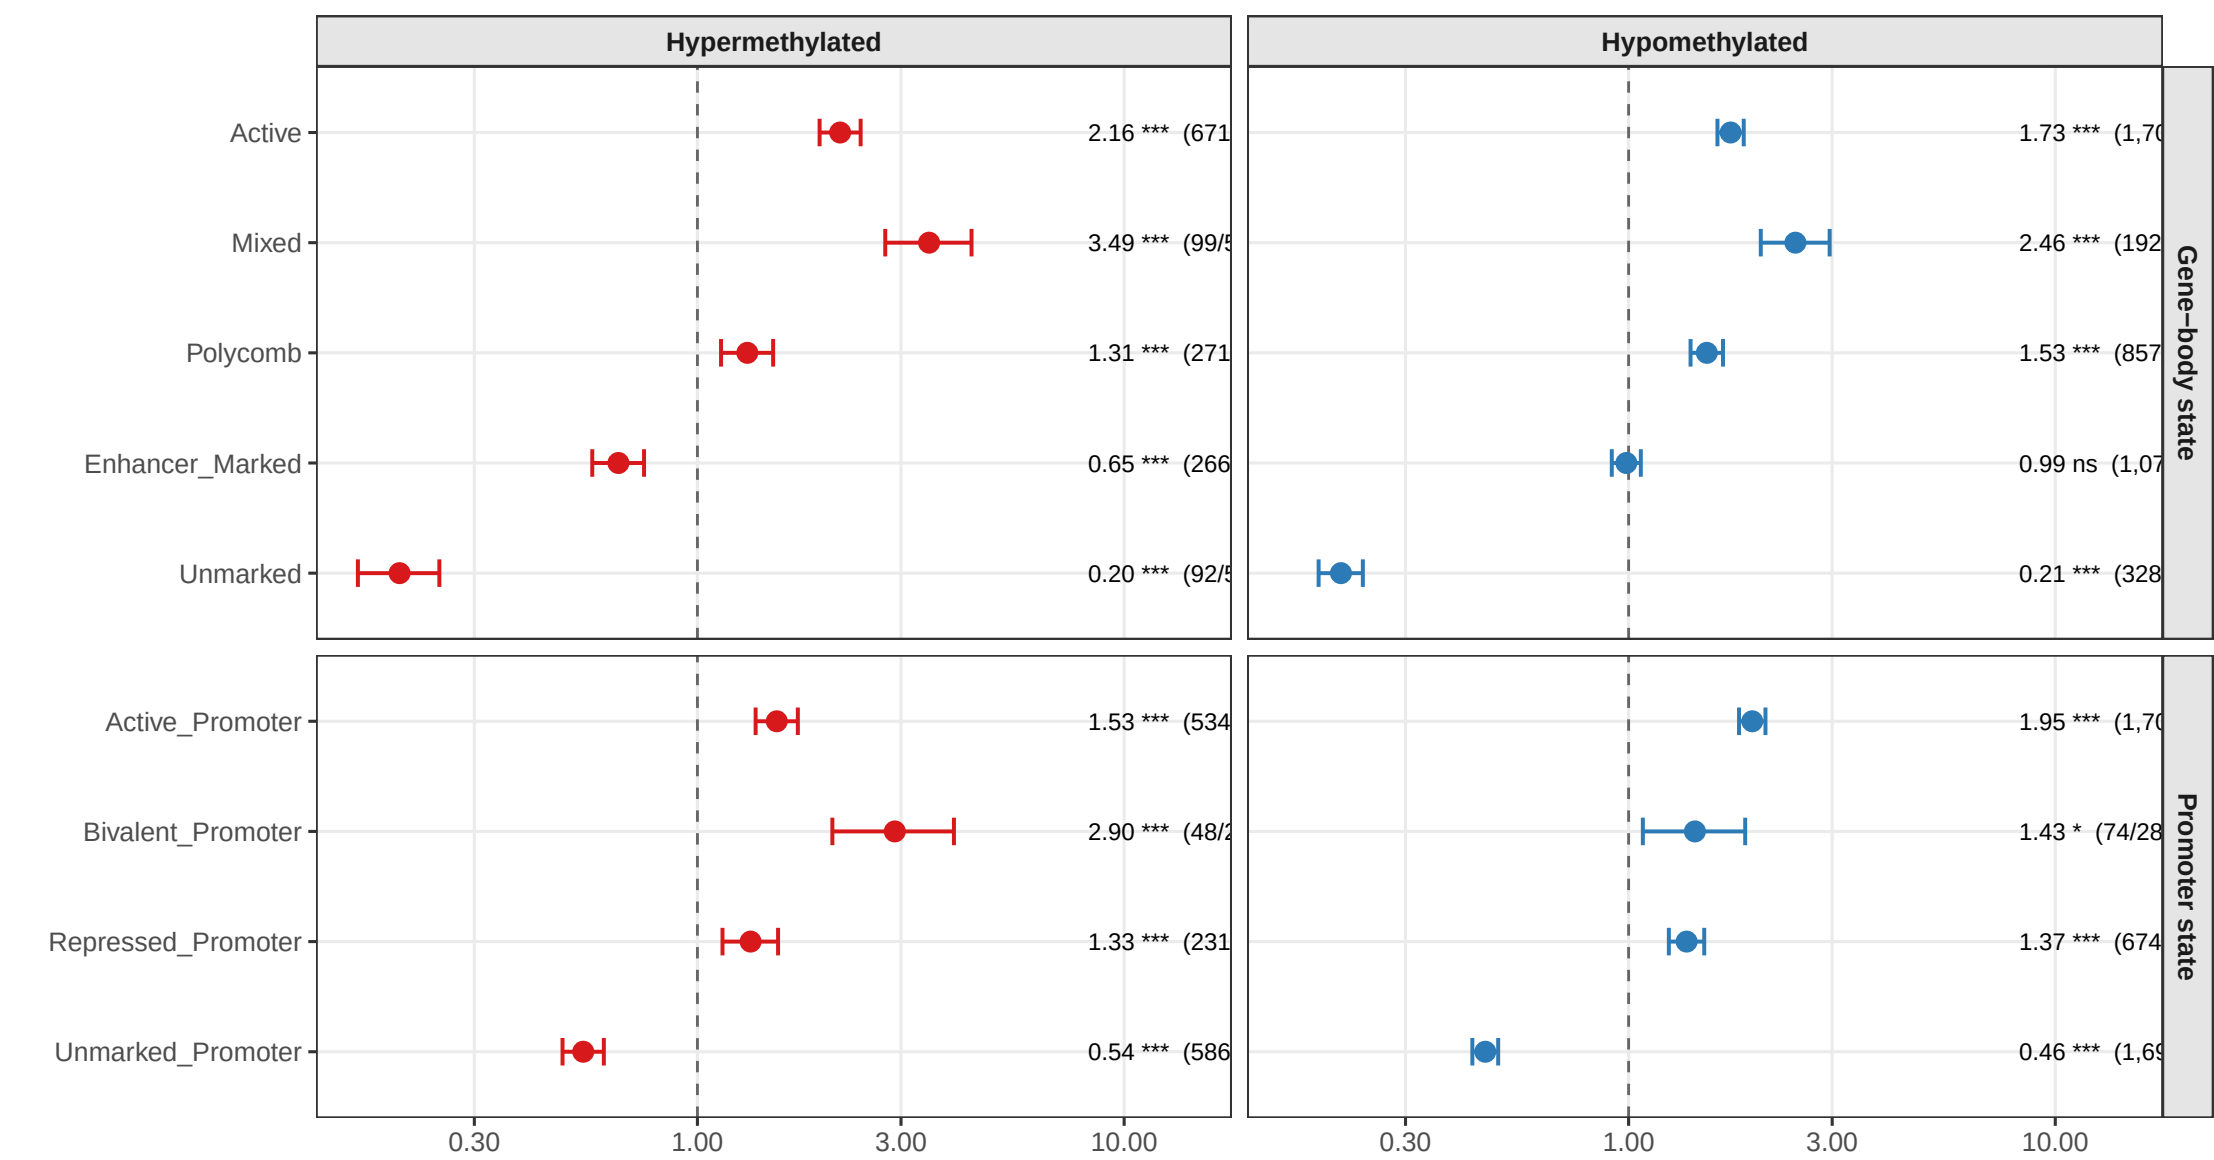

mCH direction ● Hypermethylated ● Hypomethylated

Points are conditional odds ratios; bars are 95% confidence intervals. Stars use BH-adjusted p-values.

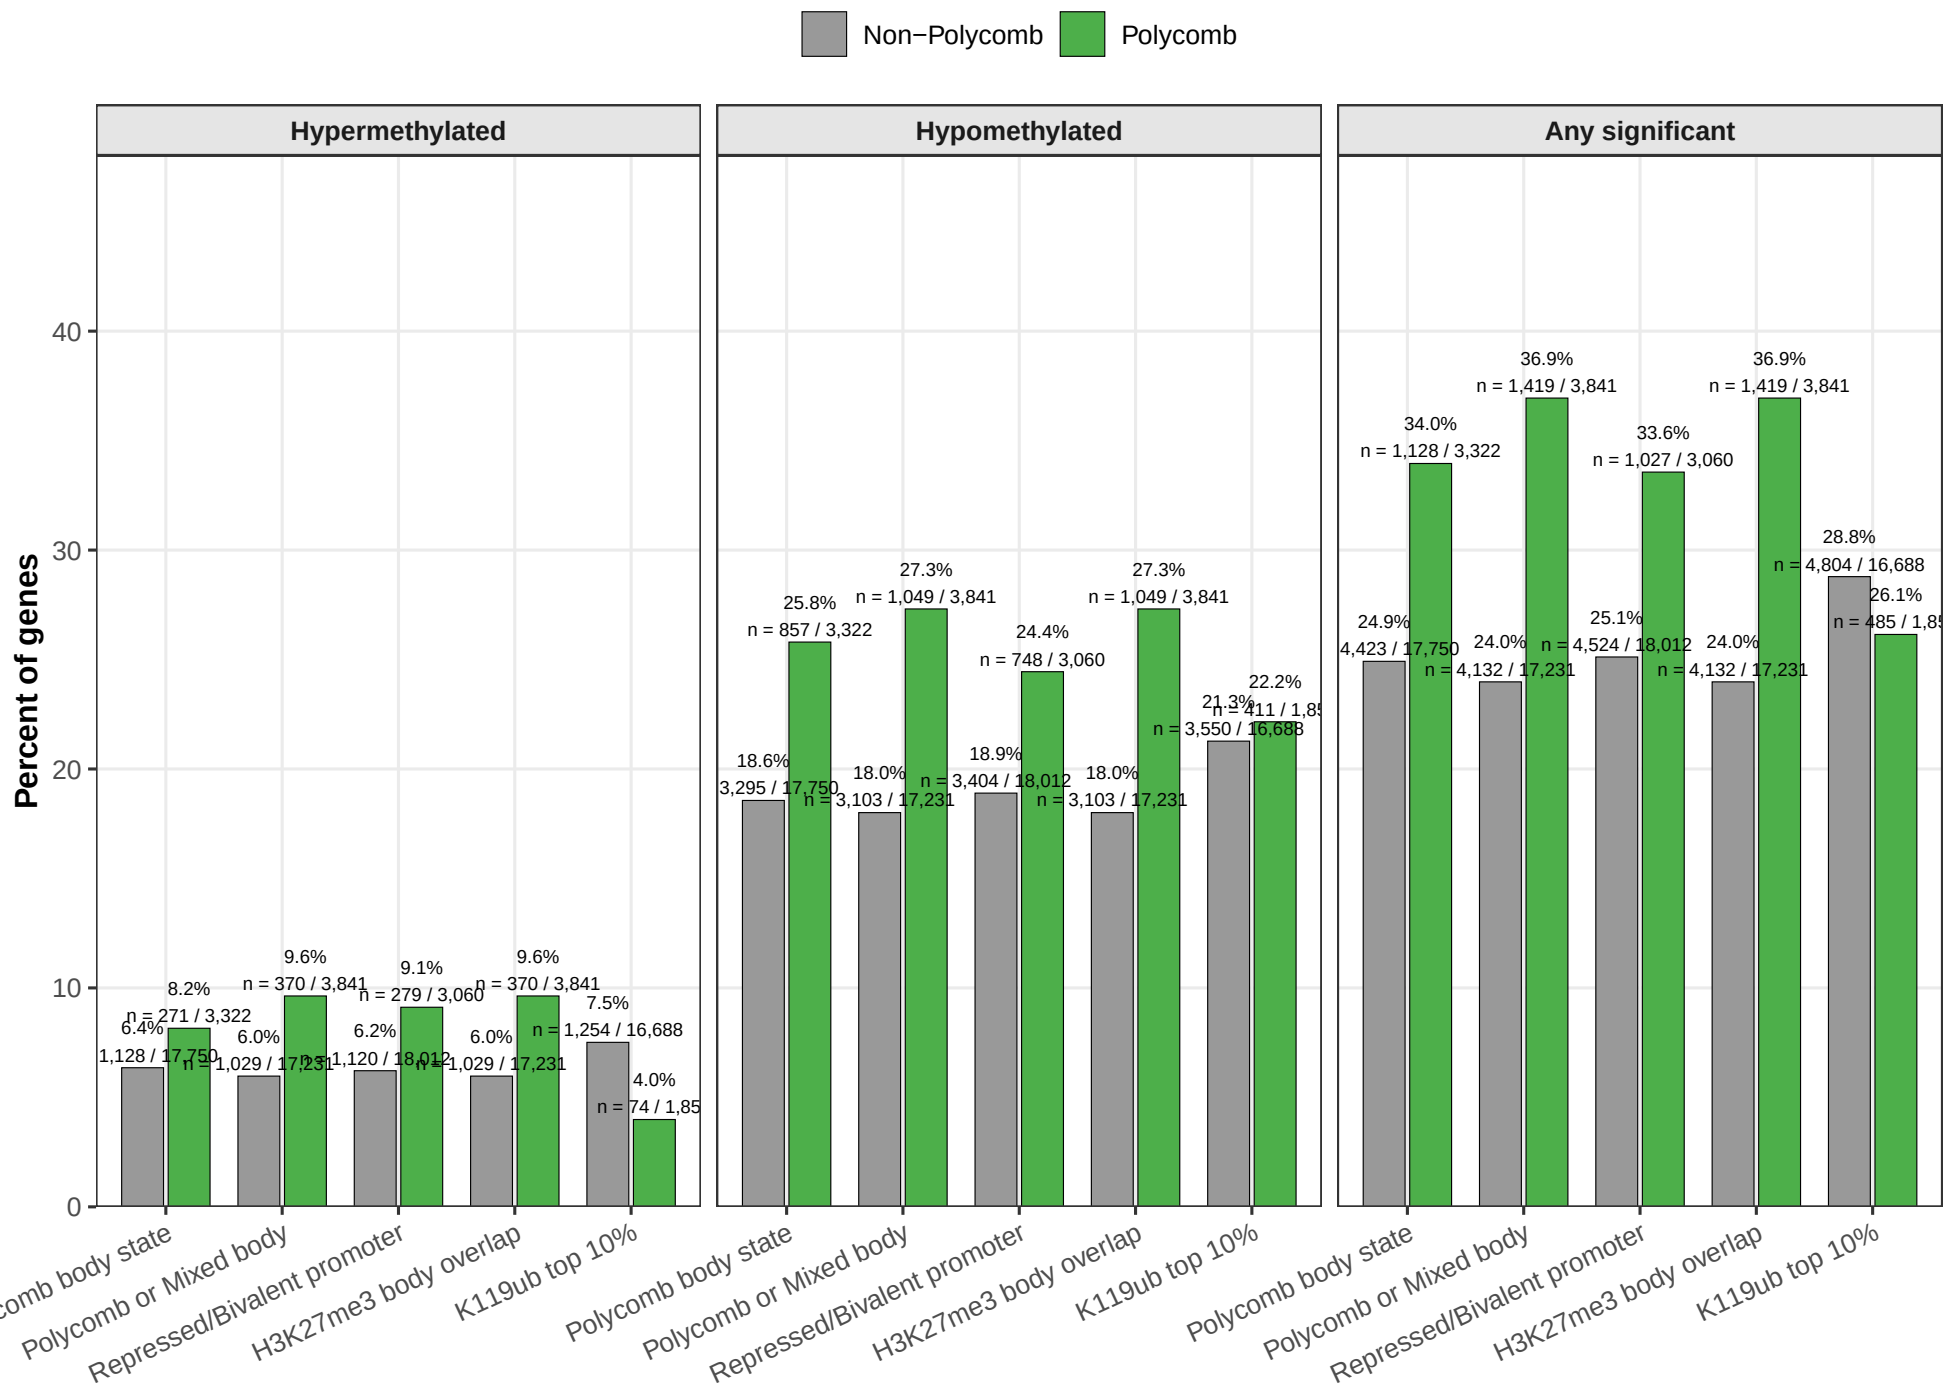

Differential mCH enrichment per chromatin state

Gene-body states in the top row, promoter states in the bottom row. Each state against every other state; counts are (direction genes in state / genes in state)

Differential mCH rate inside and outside each Polycomb definition

Percent of genes in each group that are significant, with the counts behind each bar

Odds ratio (log scale)

Points are conditional odds ratios; bars are 95% confidence intervals. Stars use BH-adjusted p-values.
