

Does mCH Change Predict MeCP2 Binding Change?

Gene length enters both models as log10 base pairs

Linear Model: MeCP2 Fold Change

mecp2_fold ~ mch_diff_pct + log10_gene_length | $R^2 = 0.0509$ (all genes, n = 17,096)

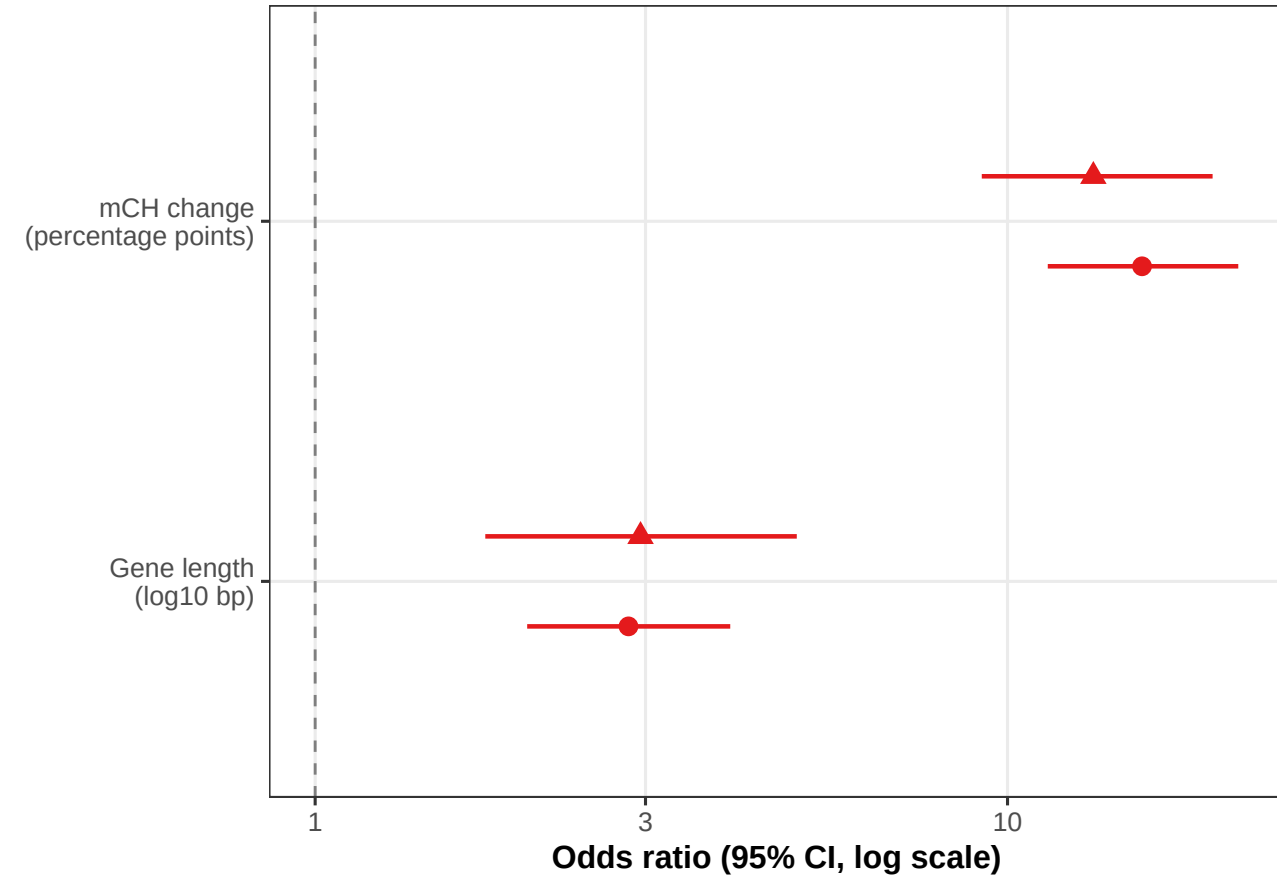

Gene set ● all_genes_with_mecp2 ▲ mch_significant

Significance ● p < 0.05

Logistic Model: Probability of MeCP2 Gain

mecp2_gain ~ mch_diff_pct + log10_gene_length | AIC = 897.3 (all genes)

Gene set ● all_genes_with_mecp2 ▲ mch_significant

Significance ● p < 0.05
