

Gene-level effect sizes: H2AK119ub, MeCP2, H3K27ac, H3K27me3 and mCH

Every panel counts genes per quadrant and reports the Spearman correlation over the genes it plots

A

H2AK119ub against MeCP2 at gene bodies

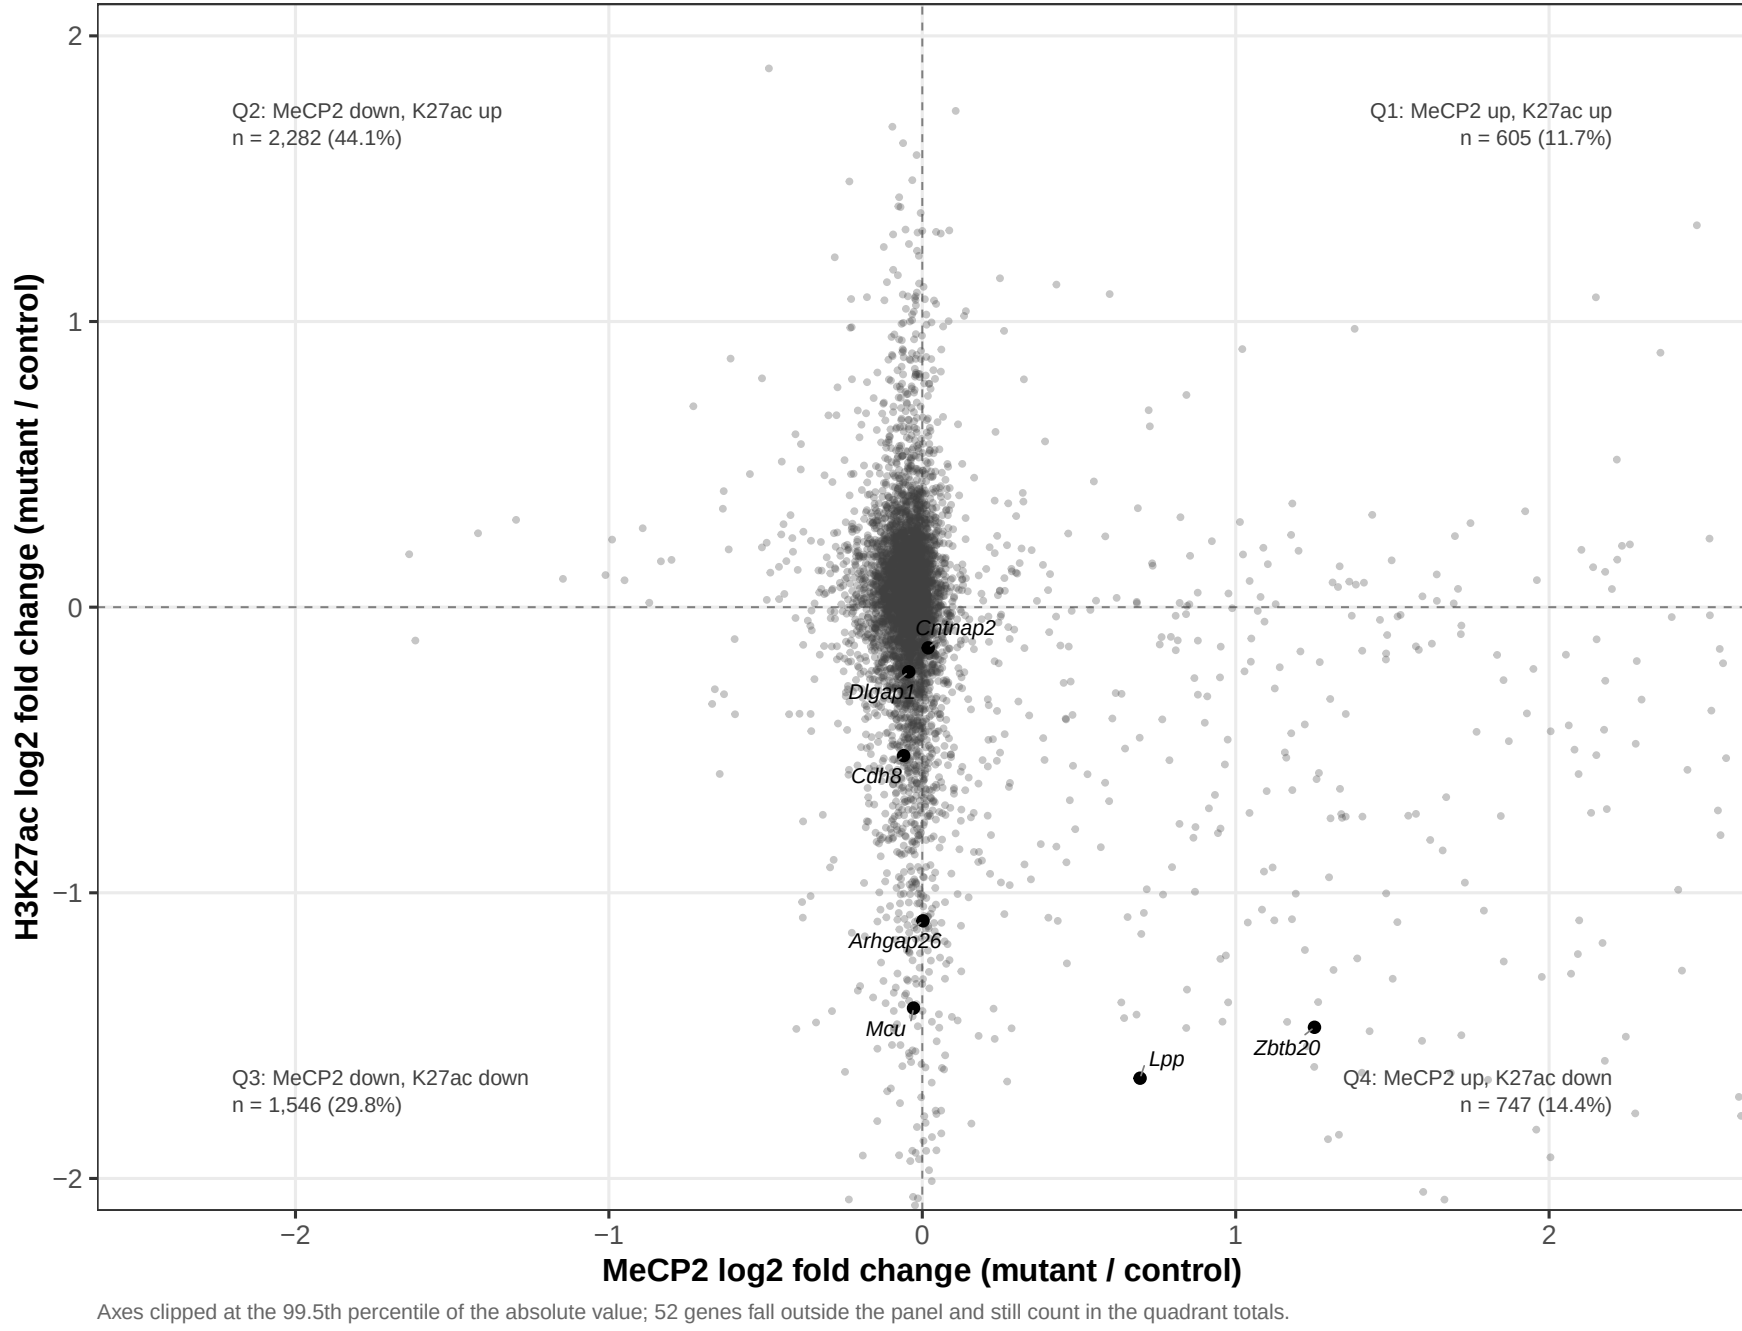

Spearman rho = 0.169, $p < 2.2\text{e-}16$ | n = 9,399 genes with quantifiable H2AK119ub bigwig signal

B

MeCP2 against H3K27ac in euchromatin

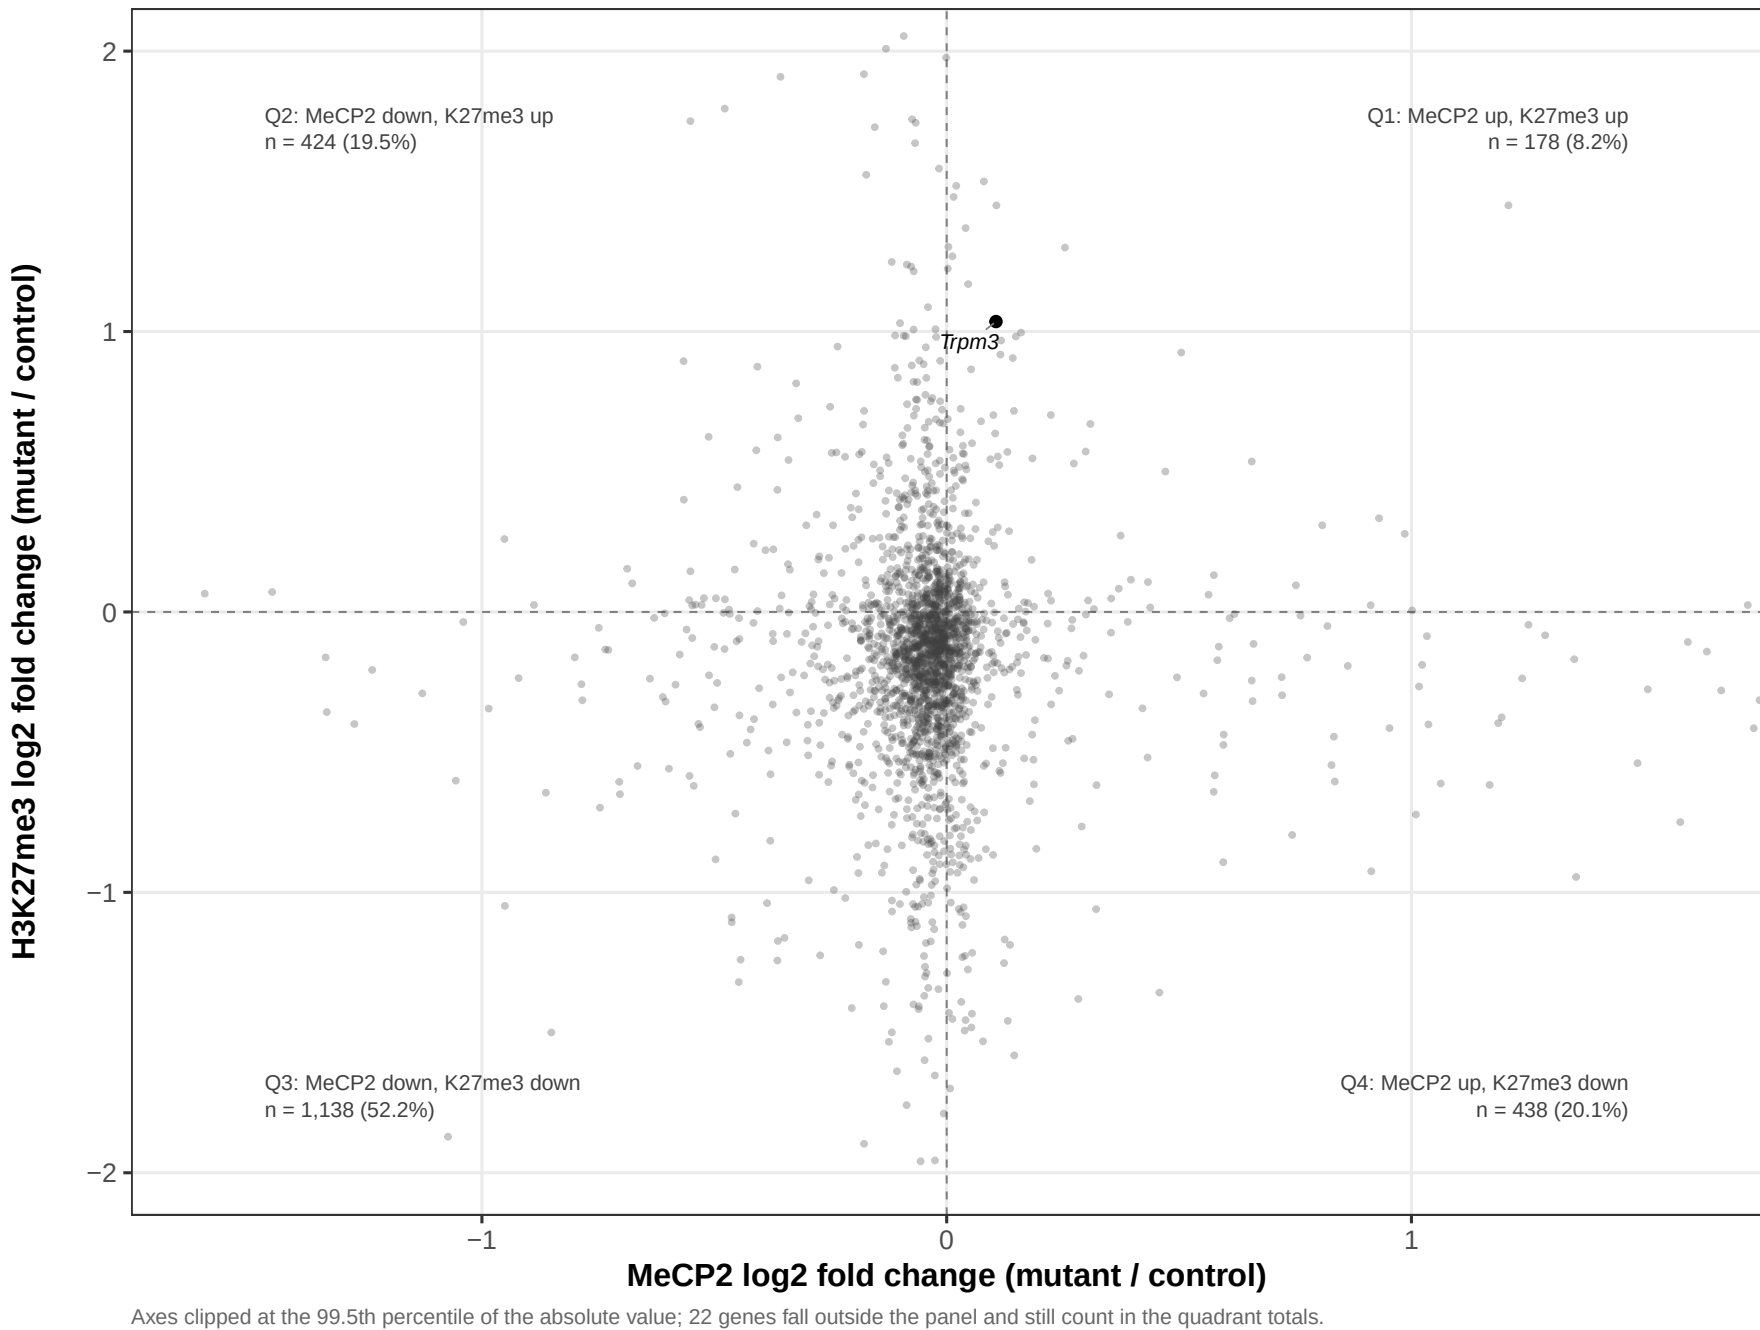

Spearman rho = -0.135, $p < 2.2\text{e-}16$ | n = 5,180 euchromatic genes (gene-body state Active or Enhancer_Marked)

C

MeCP2 against H3K27me3 in heterochromatin

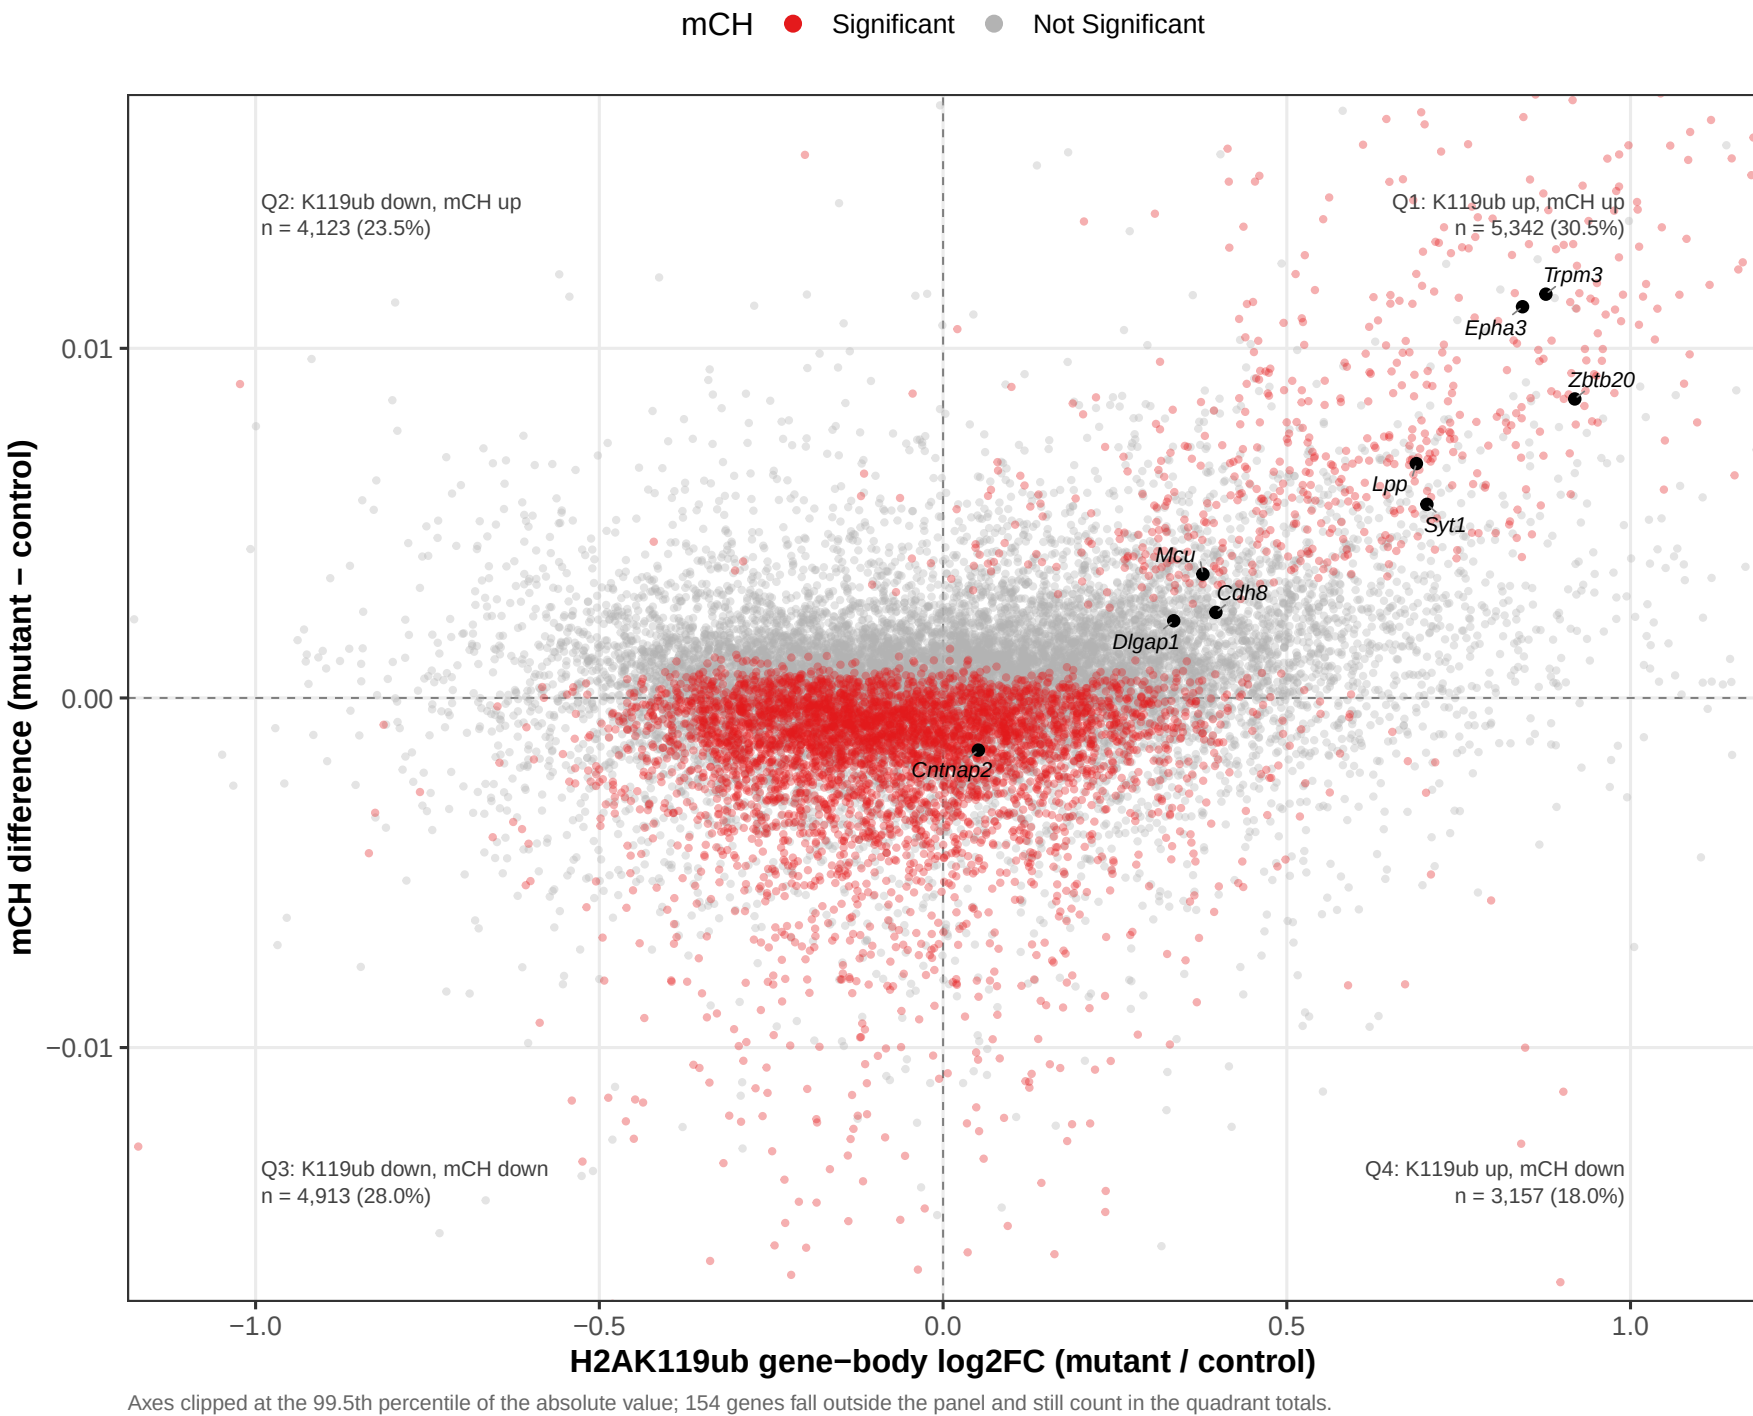

Spearman rho = 0.009, $p = 6.79\text{e-}01$ | n = 2,178 heterochromatic genes (gene-body state Polycomb or Mixed)

D

H2AK119ub against gene-body mCH change

Spearman rho = 0.261, $p < 2.2\text{e-}16$ | n = 17,535 genes with quantifiable H2AK119ub bigwig signal

E

MeCP2 against gene-body mCH change

Spearman rho = 0.207, $p < 2.2\text{e-}16$ | n = 9,517 every gene with a MeCP2 peak
